# BENZAMIDE DERIVATIVES AND THEIR USE AS APOB-100 SECRETION INHIBITORS

This invention relates to novel compounds which inhibit hepatic production of apoprotein B-100 (apoB-100), and to processes for their preparation, pharmaceutical compositions containing them and their medical use.

ApoB-100 is the main protein component of low density lipoprotein-cholesterol (LDL-C). High LDL-C plasmatic levels are a major risk factor for atherosclerosis and coronary artery diseases. ApoB-100 plasmatic levels correlate with LDL-C plasmatic levels and also constitute a cardiovascular risk factor in themselves. ApoB-100 is exclusively produced by hepatocytes and reducing hepatic production of ApoB-100 should induce a decrease of LDL-C plasmatic levels.

Compounds having ApoB-100 inhibition properties have been described in WO96/40640, which is incorporated herein by reference.

15 The term "physiologically functional derivative" as used herein refers to any physiologically acceptable derivative of a compound of the present invention, for example, an ester, which upon administration to a mammal, such as a human, is capable of providing (directly or indirectly) such a compound or an active metabolite thereof. Such derivatives are clear to those skilled in the art, without undue experimentation, and with reference to the teaching of Burger's Medicinal Chemistry And Drug Discovery, 5th Edition, Vol 1: Principles And Practice, 20 which is incorporated herein by reference.

25 The compounds of the invention are inhibitors of hepatic production of apoB-100 and are thus of use in the treatment of conditions resulting from elevated circulating levels of apoB-100.

30 The ability of the compounds of the invention to inhibit the production of apoB-100 by human hepatocytes in vitro is determined using primary human hepatocytes as a model system. The specificity of the compounds of the invention is established by comparing the effects on apoB-100, apoprotein A-1, and fibrinogen production. A specificity of at least 100 is preferred.

35 The in vivo profile of the compounds was determined by acute oral administration of the compounds of the invention to DBA/2 mice and Wistar rats with measurement of apoB-100 plasmatic levels as percentage of control values. Active compounds are further evaluated in Wistar rats by repeated oral

administration (once a day) with measurement of total cholesterol, low density lipoprotein-cholesterol, triglycerides, apoB-100 and apoA-I plasmatic levels as a percentage of control values.

5 The compounds of the invention are potent and specific inhibitors of hepatic production of apoB-100, which furthermore exhibit good oral bioavailability and duration of action.

10 Compounds of the invention are of use in the treatment of atherosclerosis, pancreatitis, non-insulin dependent diabetes mellitus (NIDDM), and coronary heart diseases.

15 Compounds of the invention are also useful in lowering serum lipid levels, cholesterol and/or triglycerides, and are of use in the treatment of hyperlipemia, hyperlipidemia, hyperlipoproteinemia, hypercholesterolemia and/or hypertriglyceridemia.

20 The invention therefore provides a compound of formula (I) or a physiologically acceptable salt, solvate or derivative thereof for use in therapy, in particular in human medicine.

25 There is also provided as a further aspect of the invention the use of a compound of formula (I) or a physiologically acceptable salt, solvate or derivative thereof in the preparation of a medicament for use in the treatment of conditions resulting from elevated circulating levels of apoB-100.

30 In an alternative or further aspect there is provided a method for the treatment of a mammal, including man, in particular in the treatment of conditions resulting from elevated circulating levels of apoB-100, comprising administration of an effective amount of a compound of formula (I) or a physiologically acceptable salt, solvate or derivative thereof.

It will be appreciated that reference to treatment is intended to include prophylaxis as well as the alleviation of established symptoms. Compounds of

formula (I) may be administered as the raw chemical but the active ingredient is preferably presented as a pharmaceutical formulation.

Accordingly, the invention also provides a pharmaceutical composition which comprises at least one compound of formula (I) or a physiologically acceptable salt, solvate or derivative thereof and formulated for administration by any convenient route. Such compositions are preferably in a form adapted for use in medicine, in particular human medicine, and can conveniently be formulated in a conventional manner using one or more pharmaceutically acceptable carriers or excipients.

Thus compounds of formula (I) may be formulated for oral, buccal, parenteral, transdermal, topical (including ophthalmic and nasal), depot or rectal administration or in a form suitable for administration by inhalation or insufflation (either through the mouth or nose).

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters, ethyl alcohol or fractionated vegetable oils); and preservatives (e.g. methyl or propyl-p-hydroxybenzoates or sorbic acid). The preparations may also contain buffer salts, flavouring, colouring and sweetening agents as appropriate.

Preparations for oral administration may be suitably formulated to give controlled release of the active compound.

5 For buccal administration the composition may take the form of tablets or lozenges formulated in conventional manner.

15 The compounds of the invention may be formulated for parenteral administration by bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form e.g. in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising and/or dispersing agents. Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

25 The compounds of the invention may be formulated for topical administration in the form of ointments, creams, gels, lotions, pessaries, aerosols or drops (e.g. eye, ear or nose drops). Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Ointments for administration to the eye may be manufactured in a sterile manner using sterilised components.

30 Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilising agents, dispersing agents, suspending agents, thickening agents, or colouring agents. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds of the invention may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

10 For intranasal administration, the compounds of the invention may be formulated as solutions for administration via a suitable metered or unit dose device or alternatively as a powder mix with a suitable carrier for administration using a suitable delivery device.

A proposed dose of the compounds of the invention is 0.25mg/kg to about 125mg/kg bodyweight per day e.g. 20mg/kg to 100mg/kg per day. It will be appreciated that it may be necessary to make routine variations to the dosage, depending on the age and condition of the patient and the precise dosage will be ultimately at the discretion of the attendant physician or veterinarian. The dosage will also depend on the route of administration and the particular compound selected.

20 The compounds of formula (I) may, if desired, be administered with one or more therapeutic agents and formulated for administration by any convenient route in a conventional manner. Appropriate doses will be readily appreciated by those skilled in the art. For example, the compounds of formula (I) may be administered in combination with an HMG CoA reductase inhibitor.

30 A compound of formula (I), or a physiologically acceptable salt, solvate or derivative thereof, may be prepared by the general methods outlined hereafter.

In the following description, the groups X, Y, Z, R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are as previously defined for compounds of formula (I), unless specified otherwise.

According to a general process (A), a compound of formula (I) may be prepared by reacting a compound of formula (II) with a compound of formula R<sup>1</sup>-Z-X-L

where L represents a suitable halide leaving group, e.g. chloride, under standard displacement conditions, or where X is an oxo group, L may additionally represent a hydroxy group, the reaction being effected under standard acid and amine coupling conditions.

A compound of formula (II) may be prepared by reaction of a compound of formula (III) with a compound of formula (IV)

where L is defined above and P is a suitable amine protecting group, e.g. tert-butoxycarbonyl (Boc), under standard coupling conditions for an acid and amine coupling, followed by deprotection of the protecting group under suitable conditions, e.g. acidic removal of a Boc group.

A compound of formula (IV), where A represents N, may be prepared by the two step reaction of a compound of formula (V)

24

comprising incorporation of the protecting group P using standard methodology followed by reduction of the nitro group, e.g. under hydrogenation conditions.

5

A compound of formula (IV), where A represents CH, may be prepared from a compound of formula (VI)

10

by reaction with a suitable compound of formula  $H_2N-P'$  where  $P'$  is a suitable protecting group which is labile under hydrogenation conditions, such as a benzyl group, using a suitable coupling agent or agents such as tris(dibenzylidene acetone)dipalladium, 2,2'-bis(diphenylphosphino)-1,1'-binaphthyl (binap) and sodium tert-butoxide in a suitable solvent such as toluene, followed by removal of the protecting group and reduction of the double bond under hydrogenation conditions.

15

According to a second method (B), compounds of formula (I) may be prepared by reaction of compounds of formula (III) and compounds of formula (VII)

20

where L is defined above, under standard coupling conditions.

25

Compounds of formula (VII) may be prepared by reaction of a compound of formula (V) with a compound of formula  $R^1-Z-X-L$ , where L is defined above, followed by reduction of the nitro group under hydrogenation or reductive tin chloride conditions.

5

According to a third process (C), a compound of formula (I) where Y is  $-O-C_{1-4}$ alkylene- may be prepared by reaction of a compound of formula (VIII) with a compound of formula  $R^2-C_{1-4}$ alkylene-L, where L is defined above,

10

Compounds of formula (VIII) may be prepared according to the process outlined in process B.

15 According to a fourth general process (D), a compound of formula (I), where at least part of X represents an alkylene link to the piperidine or piperazine group, may be prepared by reacting a compound of formula (II) with a compound of formula (IX)

20

where  $X'$  represents X minus a methylene group, under standard reductive amination conditions, e.g. using sodium triacetoxyborohydride in a solvent such as dichloroethane.

25

According to a fifth process (E), a compound of formula (I) may be prepared from a different compound of formula (I), using standard techniques well known in the art. For example, compounds of formula (I) where R<sup>1</sup> comprises a group containing an amide group may be prepared from the compound of formula (I) where the corresponding position comprises a carboxylic acid group, which in turn may be prepared from the compound of formula (I) where the corresponding position comprises a carboxylic ester group. Well known methods in the art may be employed to facilitate the transformation of an ester to an acid and then to an amide.

A compound of formula (III), where Y is a direct link, R<sup>2</sup> is a phenyl or an aromatic heterocyclyl and L is a hydroxy group, may be prepared firstly by coupling a boronic acid with a suitable leaving group, represented by a compound of formula (X) and a compound of formula (XI)

where R<sup>2</sup> represents phenyl or an aromatic heterocyclyl, PG represents a protected carboxylic acid and A and D represent either the boronic acid or the suitable leaving group, such as triflate or bromide, followed by deprotection of the protecting group under standard conditions, such as base removal of an ester group. Where L represents a halide leaving group, the carboxylic acid product can be treated with a suitable reagent, such as thionyl chloride, to give the corresponding chloride leaving group.

Where R<sup>1</sup> is a phenyl, substituted by an aromatic heterocyclyl, the aromatic heterocyclyl may be introduced by any well known methods in the art. For instance, where the substituent is a methyl substituted oxadiazole, this may be formed by treatment of a suitable benzamide derivative with a suitable reagent, such as dimethylacetamide dimethylacetal at elevated temperature, followed by cyclisation of the intermediate compound with hydroxylamine.

The various general methods described above may be useful for the introduction of the desired groups at any stage in the stepwise formation of the required compound, and it will be appreciated that these general methods can be combined in different ways in such multi-stage processes. The sequence of the reactions in multi-stage processes should of course be chosen so that the reaction conditions used do not affect groups in the molecule which are desired in the final product.

Compounds of formula  $R^1-Z-X-L$ , (III), (V) and (VI), (IX), (X) and (XI) are known or may be prepared by standard methods well known in the art and/or herein described.

Physiologically acceptable salts may also be prepared from other salts, including other physiologically acceptable salts, of the compound of formula (I) using conventional methods.

The compounds of formula (I) may readily be isolated in association with solvent molecules by crystallisation from or evaporation of an appropriate solvent to give the corresponding solvates.

When a specific enantiomer of a compound of general formula (I) is required, this may be obtained for example by resolution of a corresponding enantiomeric mixture of a compound of formula (I) using conventional methods.

Thus, in one example an appropriate optically active acid may be used to form salts with the enantiomeric mixture of a compound of general formula (I). The resulting mixture of isomeric salts may be separated, for example, by fractional crystallisation into the diastereoisomeric salts from which the required enantiomer of a compound of general formula (I) may be isolated by conversion into the required free base.

Alternatively, enantiomers of a compound of general formula (I) may be synthesised from the appropriate optically active intermediates using any of the general processes described herein.

The invention is further illustrated by the following intermediates and examples. All temperatures are in degrees centigrade.

#### Biological Assay

Primary human hepatocytes were seeded at 50 000 cells/well in 96 well plates. After an overnight adhesion phase, cells were incubated with compounds for 8 hours in RPMI medium containing 1% FCS, 4 µg/ml insulin, 100 nM dexamethasone and 50 µCi/ml <sup>35</sup>S-methionine. Compounds were dissolved in DMSO and tested onto cells from 1 µM to 1.6 nM. Production of radiolabeled apoB-100 and apoA-1 (used as a selectivity control) was quantified by analysis of supernatants using SDS PAGE and exposure of gels onto PhosphorImager screens. Inhibition of apoB-100 and apoA-1 secretion by compounds was calculated taking untreated cells as controls, and IC<sub>50</sub> of each compound was determined on both apoproteins. The following results were obtained for a selection of compounds of the invention:

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 24  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claim 24  
is directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
